

DELTA technology helps rabbits breed...like rabbits!

DELTA Magnetic Water Conditioners have provided Wagga Wagga's Ian and Joyce Lungley with confidence to press ahead in an emerging rabbit-meat industry.

The quality of drinking water for the Lungley's rabbits is crucial to success in breeding and developing their enterprise. But investigations revealed salt levels in a bore supply was hindering the development of their animals and preventing brood stock from falling pregnant. It was costing time and money.

Problem: Poor rabbit health and viability because of saline drinking water.

Solution: Installation of a DELTA Magnetic Water Conditioner.

Result: Magnetic conditioning dispersed salt in the water. The Lungley's rabbits became healthier and more productive.

Ian Lungley is confident the demand for rabbit will increase and just as confident that he now has better-quality water to help meet demand.

"It made a big difference. We soon had a lot more rabbit kittens and better quality rabbits. It's fantastic and I'd swear by it,"

Ian Lungley, NSW rabbit farmer

DELTA - 'spectacular' results for Texas cotton

DELTA Magnetic Water Conditioners are having profound results in Texas, the largest cotton-growing state in the United States.

DELTA'S Alex Panov, on returning from an overseas fact-finding tour, found installation of Delta conditioners in the Amarillo area of northern Texas producing 'spectacular' results.

"Cotton is quite salt tolerant but the salt level is increasing so badly there that plants haven't been able to germinate," Alex said.

"In one irrigation paddock conditions have dramatically changed after only one season of DELTA magnetic water treatment.

The paddock now shows good germination and crop potential."

Texas A and M University, an internationally-recognised agricultural and mining institution, has launched a monitoring program to understand more about the DELTA technology.

Problem: Salinity impact on broadacre cotton-growing potential.

Solution: Installation of DELTA Magnetic Water Conditioners.

Results: More productive land; cotton plants thriving.

Salinity- the benefits of DELTA technology

DELTA Magnetic Water Conditioners help combat salty water.

They can help prevent:

- > Leaf burn
- > Poor plant and crop yields
- > Plants from becoming yellow and dying
- > Deterioration of soil structure
- > Irrigation system corrosion

They encourage:

- > The potential for more overhead watering of leafy plants
- > Greater productivity of agricultural sites
- > Greater potential for crop germination
- > Healthier and more productive livestock
- > Irrigation systems to run smoothly

Dry conditions prompt strong interest in DELTA

Visitors to AgQuip Field Days at Gunnedah in NSW in August readily sought out DELTAwater solutions to find ways of improving the quality of bore supplies. DELTA's Alex Panov said interest in the technology was strong and reflected persisting dry conditions throughout much of NSW and Queensland.

"People came and saw us with purpose - looking for a solution for their problems. They weren't just walking past our site. They wanted to know about us, what we did and to see if we could help them," he said.

"The falling quality of bore water is an issue. The drought has meant there has been no recharge of aquifers for many years. There was interest from people with stock-watering, domestic and garden systems and as well as major irrigators and mining firms."

"Once the old water was out of the line you could notice a different in taste. We also noticed the lathering on the horses straight away and then the impact on the ground – the soil now seems so much softer and grass has started to take over,"

Wayne Dean, Aradean Arabian stud.

DELTA provides answers for horse stud

Horse-care and the power of magnets might seem an odd fit but good-quality water for watering and grooming the animals is essential. It's an issue that confronted Wayne and Monique Dean of Dalby in Queensland and prompted them to approach DELTAwater solutions.

The Deans run Aradean Arabian stud, breeding and showing several horses. They needed greater supply for the horses and sunk a bore to tap into an underground supply. But the plan hit a major snag.

The water was 'hard' and caused problems such as scale, cracks in the ground and salting. A major problem was the Deans couldn't lather the water to wash their horses.

The Deans sent a water sample to DELTA, who promptly responded with a recommendation. A DELTA Magnetic Water Conditioner went on the bore pipe and circumstances quickly improved.

The Deans have now upgraded their DELTA conditioner for even better results.

Problem: Hard water presents horse-watering and grooming problems.

Solution: Installation of DELTA Magnetic Water Conditioner.

Results: Water lathers readily, conditions generally improve.
