PRODUCT

Sick of cleaning scale build-up off your evaporative air-conditioning pads?

DELTA has the solution!

The DELTA Evaporative Air Conditioner Water Treatment product is custom-designed to treat the problems caused by high levels of hardness, salinity, minerals and iron in water in evaporative air-conditioning units.

After you install a DELTA Evaporative Air Conditioner unit, your air-conditioning pads will be cleaner and you will notice:

- Improved efficiency
- Less maintenance
- Reduced running costs

Geoff Menzies from Warren in NSW installed a DELTA unit in his work premises at Menzies Pumps and Irrigation. He was looking for a solution to get rid of the scale that built up in his air conditioner during summer, requiring a full clean and maintenance every year.

He didn't pre-clean the batts and said he was amazed when he pulled the air conditioner apart at the end of summer for its regular maintenance that not only was the old scale on the batts gone, but there was no new scale on the batts.

"It was amazing. No more maintenance!"

Geoff Menzies, Warren NSW

Installation is easy

The DELTA Air Conditioner Water Treatment unit is installed inside the evaporative air conditioner on the 20mm pipe that delivers water from the pump to the top of the evaporative cooling pads/batts. You simply pull the pipe off the pump and put it through the DELTA unit, then push it back onto the outlet fitting of the pump. The DELTA unit sits on the pump.

Dimensions

- Length 65mm
- Diameter 75mm
- Hole 25mm diameter
- Weight 510 grams
